Received 06.08.2026; revised 25.08.2026; accepted 22.10.2026

A construct of a remote wireless optical data transmission system based on a reflecting matrix screen is proposed. The operability of the key element of the screen – a cell with a variable reflectivity – has been experimentally confirmed. A feature of the system is the ability to operate the screen at low arctic temperatures and its energy efficiency.

Keywords: wireless optical data transmission, matrix screen, arctic temperatures.
